

## Stereotest

We present two target rectangles in front of the observer. For one of the targets, we present slightly dispar images to the left and the right eye, resulting in a perception of depth when stereovision is intact (Figure 1).

*Figure 1*

To compute the stereo acuity, measured in arc sec, we compare the visual angle (Figure 2, red, “gamma”) for regular viewing, to the visual cone elicited by the dispar images (Figure 3, red, gamma).
